Technical Requirements:

I plan to use a combination of HTML, CSS, and JavaScript to create the portfolio. I'll ensure that the site is for browsers on personal computers, with a focus on optimizing the user interface for desktop and laptop displays. I can look into using a viewport meta tag to specify the width. I also including meta tags, headings, and structured data in order to improve SEO performance. While I'm not specifying exact targets, I'll aim to keep the page delivery sizes in bytes as low as possible to ensure fast loading times and an optimal user experience.

Content Requirements:

For the development of my personal portfolio website, I will need to gather or create several types of content and media assets.

Text Content: Personal Biography, Projects and work experiences.

Images and Visual Assets: Images and graphics will be needed to highlight certain aspects of the site.

Videos: If applicable, video content may be required to present dynamic or multimedia projects.

Graphic Design Elements: Icons, illustrations, or custom graphics may be needed to enhance the overall visual design and branding of the website.

Resume or CV: Up to date resume may be needed for the site.

Links and References: I may need to collect links to external sources, such as GitHub repositories or LinkedIn.
